This page shows a variety of notations used to represent color including ways you can define colors in HTML or style sheets in a mobile-friendly HTML implementation.

You can see shades of these colors to use in creating color schemes.

gray27

The colors in the chart below come <u>from a variety of sources</u>. Color swatches are defined by using the hexadecimal code for the color and are sorted by the hue, saturation, and light values for the color. The chart below shows each color's RGB <u>hexadecimal code</u>, <u>decimal code</u>, <u>percent code</u>, <u>HSL (hue, saturation, light) code</u>, and the <u>CMYK code</u> (for comparison--*CMYK is not used in HTML or CSS*). You can see these same colors <u>in "chip" form defined by hexadecimal code and grouped by hue, saturation, and light.</u> The color names are descriptive and shouldn't be used to specify a color unless you are using the 16 named colors or SVG colors. See the <u>quick reference table for an explanation of the meaning of the labels (Safe 16 SVG Hex3).</u>

You can use different formats of this same information. (To vote for this mobile version, share this link: SHARE SHARE
